The l3pdfmeta module
PDF standards
LaTeX PDF management bundle

The LaTeX Project*

Version 0.97c, released 2026-05-26

1 l3pdfmeta documentation

This module sets up some tools and commands needed for PDF standards in general. The goal is to collect the requirements and to provide code to check and fulfill them.

1.1 Standard families

A PDF can claim that it complies to more than one standard but always only to one version of a specific family. For LaTeX relevant are the A-, UA- and X-standards.

The l3pdfmeta module started with support for the A-standards, some basic support for UA- and X-requirements were added in a rather ad-hoc way because there isn't a easy way to merge requirements and because a merge loses the option to report for which standard a requirement failed: if e.g. A-4 requires PDF 2.0 and UA-1 PDF 1.7 it is not clear what a merge should do.

So instead of merging the requirements the code now keeps track of the requirements of standard *families* (currently A, UA and X) and offers a command to switch the family to enable validation of their requirements. The default family is always the A-family – it has the largest numbers of requirements and also the largest numbers of requirements that the code can actually check.

1.2 Verifying requirements of PDF standards

Standards like pdf/A set requirements on a PDF: Some things have be in the PDF, e.g. the catalog has to contain a /Lang entry and an colorprofile and an /OutputIntent, some other things are forbidden or restricted, e.g. the action dictionary of an annotation should not contain Javascript.

The l3pdfmeta module collects a number of relevant requirements, tries to enforce the ones which can be enforced and offers some tools for package authors to test if an action is allowed in the standard or not.

This is work in progress and more tests will be added. But it should be noted that it will probably never be possible to prevent all forbidden actions or enforce all required

*E-mail: latex-team@latex-project.org

ones or even to simply check all of them. The commands here don't replace a check with an external validator.

Verifying against a PDF-standard involves two different task:

- Check if you are allowed to ignore the requirement.
- Decide which action to take if the answer to the first question is NO.

The following conditionals address the first task. Because of the second task a return value `FALSE` means that the standard requires you to do some special action. `TRUE` means that you can ignore this requirement.[1]

In most cases it only matters if a requirement is in the standard, for example `Catalog_no_OCProperties` means "don't use `/OCProperties` in the catalog". For a small number of requirements it is also needed to test a user value against a standard value. For example, `named_actions` restricts the allowed named actions in an annotation of subtype `/Named`, in this case it is needed to check not only if the requirement is in the standard but also if the user value is in the allowed list.

`\pdfmeta_standard_family:nn` `\pdfmeta_standard_family:nn {⟨family⟩} {⟨code⟩}`

This command allows to change the family for which requirements should be checked. ⟨*family*⟩ should be one of `A`, `X` or `UA`. The function switches to the requirements of this family, then executes ⟨*code*⟩ and then switches back to the A-standard family (this means that the command is not needed for a test of an A-standard requirement as that is the default anyway). ⟨*code*⟩ can do testing or retrieve values or other things but it shouldn't contain another `\pdfmeta_standard_family:nn`.

`\pdfmeta_standard_verify:nTF` ⋆ `\pdfmeta_standard_verify:nTF {⟨requirement⟩} {⟨true code⟩} {⟨false code⟩}`

This checks if ⟨*requirement*⟩ is listed in the standard. `FALSE` as result means that the requirement is in the standard and that probably some special action is required—which one depends on the requirement, see the descriptions below. `TRUE` means that the requirement is not there and so no special action is needed. This check can be used for simple requirements where neither a user nor a standard value is of importance.

`\pdfmeta_standard_verify:nnTF` `\pdfmeta_standard_verify:nnTF {⟨requirement⟩} {⟨value⟩} {⟨true code⟩} {⟨false code⟩}`

This checks if ⟨*requirement*⟩ is listed in the standard, if yes it tries to find a predefined test handler for the requirement and passes ⟨*value*⟩ and the value recorded in the standard to it. The handler returns `FALSE` if some special action is needed (e.g. if ⟨*value*⟩ violates the rule) and `TRUE` if no special action is needed. If no handler exists this commands works like `\pdfmeta_standard_verify:n`.

In some cases one needs to query the value in the standard, e.g. to correct a wrong minimal PDF version you need to know which version is required by `min_pdf_version`. For this two commands to access the value are provided:

`\pdfmeta_standard_item:n` ⋆ `\pdfmeta_standard_item:n {⟨requirement⟩}`

This retrieves the value of ⟨*requirement*⟩ and leaves it in the input. If the requirement isn't in the standard the result is empty, that means that requirements not in the standard and requirement without values can not be distinguished here.

[1] One could also make the logic the other way round—there are arguments for both—but I had to decide.

\pdfmeta_standard_get:nN

\pdfmeta_standard_get:nN {⟨*requirement*⟩} ⟨*tl var*⟩

This retrieves the value of ⟨*requirement*⟩ and stores it in the ⟨*tl var*⟩. If the ⟨*requirement*⟩ is not found the special value \q_no_value is used. The ⟨*tl var*⟩ is assigned locally.

The following describe the requirements which can be currently tested. Requirements with a value should use \pdfmeta_standard_verify:nn or \pdfmeta_standard_verify:nnN to test a local value against the standard. The rule numbers refer to https://docs.verapdf.org/validation/pdfa-part1/

1.2.1 Simple tests without handler

outputintent_A requires to embed a color profile and reference it in a /Outputintent and that all output intents reference the same colorprofile. The value stores the subtype. *This requirement is detected and fulfilled by l3pdfmeta if the provided interface in* \DocumentMetadata *or* \SetKeys[document/metadata] *is used, see below.*

annot_flags in annotations the Print flag should be true, Hidden, Invisible, NoView should be false. *This requirement is detected and set by l3pdfmeta for annotations created with the l3pdfannot. A new check is only needed if the flags are changed or if links are created by other means.*

no_encryption don't encrypt

no_external_content no /F, /FFilter, or /FDecodeParms in stream dictionaries

no_embed_content no /EF key in filespec, no /Type/EmbeddedFiles. *This will be checked in future by l3pdffiles for the files it embeds.* The restriction is set only for PDF/A-1 versions. PDF/A-2 and PDF/A-3 lifted this restriction: PDF/A-2 allows to embed other PDF documents conforming to either PDF/A-1 or PDF/A-2, and PDF/A-3 and PDF/A-4F allows any embedded files.

only_pdfa_embed_content This is set for PDF/A-2a, PDF/A-2b, PDF/A-2u and PDF/A-4. I don't see a way to test the PDF/A-2 requirement so currently it will simply allow everything. Perhaps a test for at least the PDF-format will be added in future.

Catalog_no_OCProperties don't add /OCProperties to the catalog *l3pdfmeta removes this entry at the end of the document*

Catalog_OCProperties_no_AS do not use /AS optional content configuration dictionary.

Catalog_EmbeddedFiles ensure that an EmbeddedFiles name tree is in the catalog. This is required for PDF/A-4f.

annot_widget_no_AA (rule 6.6.2-1) no AA dictionary in widget annotation, this will e.g. be checked by the new hyperref driver.

annot_widget_no_A_AA (rule 6.9-2) no A and AA dictionary in widget.

form_no_AA (6.9-3) no /AA dictionary in form field

`unicode` that is set in the U-standards, A-2u and A-3u and means that every text should be in unicode. This is not something that can be enforced or tested from TeX, but in a current LaTeX normally ToUnicode are set for all fonts.

`tagged` that is set in A-2a and A-3a and means that the pdf must be tagged. This is currently neither tested not enforced somewhere.

`no_CharSet` CharSet is deprecated is pdf 2.0 and should not be used in A-4. l3pdfmeta will therefore suppress it for the engines pdftex and luatex (the other engines have no suitable option)

`omit_CID` This avoids with PDF/A-2 and newer a failure because of with missing CID identifications (e.g. from rule ISO 19005-2:2011, Clause: 6.2.11.4.2) It has only with luatex an effect.

`Trailer_no_Info` The `Info` dictionary has been deprecated since quite some time. Metadata should be set with XMP-data instead. In PDF A-4 now the `Info` dictionary shall not be present in the trailer dictionary at all (unless there exists a PieceInfo entry in the Catalog). And if it is present it should only contain the `/ModDate` entry. In texlive 2023 the engines pdftex and luatex have primitives to suppress the dictionary and l3pdfmeta will make use of it.

`tagged` (A- and UA-standards) The document must be a tagged PDF.

`link_Contents` (UA-standards) A link annotation must have a `Contents` entry (true for UA-1)

1.2.2 Tests with values and special handlers

`min_pdf_version` stores the minimal PDF version needed for a standard. It should be checked against the current PDF version (`\pdf_version:`). A failure means that the version should be changed. Currently there is only one hard requirement which leads to a failure in a validator like verapdf: The A-4 standard should use PDF 2.0. As PDF A-1 is based on PDF 1.4 and PDF A-2 and A-3 are based on PDF 1.7 l3pdfmeta also sets these versions also as requirements. UA-2 requires PDF 2.0. These requirements are checked by l3pdfmeta when the standard is set with `\DocumentMetadata` or `\SetKeys[document/metadata]` and the version is if needed changed. At the begin of the document another check is done and error is issued if the version doesn't fit as this means that the document has used conflicting standard and version setting.

`max_pdf_version` stores the maximal PDF version. It should be checked against the current PDF version (`\pdf_version:`). A failure means that the version should be changed. The check is currently relevant for the A-1 to A-3 standards, PDF 2.0 leads to a failure in a validator like verapdf so the maximal version should be PDF 1.7, for UA-1 which requires PDF 1.7 or lower, and for UA-2 which requires PDF 2.0. These requirements are checked by l3pdfmeta when the standard is set with `\DocumentMetadata` or `\SetKeys[document/metadata]` and the version is if needed changed. At the begin of the document another check is done and error is issued if the version doesn't fit as this means that the document has used conflicting standard and version setting.

`named_actions` this requirement restricts the list of allowed named actions to `NextPage`, `PrevPage`, `FirstPage`, `LastPage`. The check should supply the named action without slash (e.g. `View` (failure) or `NextPage` (pass)).

`annot_action_A` (rule 6.6.1-1) this requirement restricts the allowed subtypes of the `/A` dictionary of an action. The check should supply the user subtype without slash e.g. as `GoTo` (pass) or `Movie` (failure).

1.3 Colorprofiles and OutputIntent

The pdf/A standards require that a color profile is embedded and referenced in the catalog in the `/OutputIntent` array.

The problem is that the pdf/A standards also require, that if the PDF has more then one entry in the `/OutputIntent` array (which is allowed), their `/DestOutputProfile` should all reference the same color profile[2].

Enforcing this fully is impossible if entries are added manually by users or packages with `\pdfmanagement_add:nnn {Catalog}{OutputIntents}{`⟨*object reference*⟩`}` as it is difficult to inspect and remove entries from the `/OutputIntent` array.

So we provide a dedicated interface to avoid the need of manual user settings and allow the code to handle the requirements of the standard. The interface doesn't handle yet all finer points for PDF/X standards, e.g. named profiles, it is meant as a starting point to get at least PDF/A validation here.

The interface looks like this

```
\DocumentMetadata
  {
    %other options for example pdfstandard
     colorprofiles=
      {
        A = sRGB.icc, %or a or longer GTS_PDFA1 = sRGB.icc
        X = FOGRA39L_coated.icc, % or x or longer GTS_PDFX
        ISO_PDFE1 = whatever.icc
      }

  }
```

or

```
\RequirePackage{pdfmanagement}
\Setkeys[document/metadata]
  {
    %other options for example pdfstandard
     colorprofiles=
      {
        A = sRGB.icc, %or a or longer GTS_PDFA1 = sRGB.icc
        X = FOGRA39L_coated.icc, % or x or longer GTS_PDFX
        ISO_PDFE1 = whatever.icc
      }

  }
```

[2] see rule 6.2.2-2 at https://docs.verapdf.org/validation/pdfa-part1/

sRGB.icc and FOGRA39L_coated.icc (from the colorprofiles package are predefined and will work directly[3]. whatever.icc will need special setup in the document preamble to declare the values for the OutputIntent dictionary, but the interface hasn't be added yet. This will be decided later.

If an A-standard is detected or set which requires that all /DestOutputProfile reference the same color profile, the setting is changed to the equivalent of

```
\SetKeys[document/metadata]
  {
    %other options
     pdfstandard=A-2b,
     colorprofiles=
      {
        A = sRGB.icc, %or longer GTS_PDFA1 = sRGB.icc
        X = sRGB.icc,
        ISO_PDFE1 = sRGB.icc
      }

  }
```

The pdf/A standards will use A=sRGB.icc by default, so this doesn't need to be declared explicitly.

1.4 Regression tests

When doing regression tests one has to set various metadata to fix values.

\pdfmeta_set_regression_data: \pdfmeta_set_regression_data:

This sets various metadata to values needed by the LaTeX regression tests. It also sets the seed for random functions. If a current l3backend is used and \c_sys_timestamp_str is available, the command does not set dates, but assumes that the environment variable SOURCE_DATE_EPOCH is used.

2 XMP-metadata

XMP-metadata are data in XML format embedded in a stream inside the PDF and referenced from the /Catalog. Such a XMP-metadata stream contains various document related data, is required by various PDF standards and can replace or extend the data in the /Info dictionary. In PDF 2.0 the /Info dictionary is actually deprecated and only XMP-metadata should be used for the metadata of the PDF.

The content of a XMP-metadata stream is not a fix set of data. Typically fields like the title, the author, the language and keywords will be there. But standards like e.g. ZUGferd (a standard for electronic bills) can require to add more fields, and it is also possible to define and add purely local data.

In some workflows (e.g. if dvips + ghostscript is used) a XMP-metadata stream with some standard content is added automatically by the backend, but normally it must be created with code.

[3]The dvips route will require that ps2pdf is called with -dNOSAFER, and that the color profiles are in the current folder as ps2pdf doesn't use kpathsea to find them.

For this task the packages hyperxmp, xmpincl or pdfx (which uses xmpincl) can be used, but all these packages are not compatible with the pdfmanagement[4]. The following code is meant as replacement for these packages.

hyperxmp uses `\hypersetup` as user interface to enter the XMP-metadata. This syntax is also supported by the new code[5], so if hyperref has been loaded, e.g. `pdftitle=xxx` can be used to set the title. But XMP-metadata shouldn't require to use hyperref and in a future version an interface without hyperref will be added.

There is currently no full user interface command to extend the XMP-metadata with for example the code needed for ZUGferd, they will be added in a second step.

2.1 Debug option

The resulting XMP-packet can be written to an external file by activating a debug option

```
\DocumentMetadata{debug={xmp-export}}
%or
\DocumentMetadata{debug={xmp-export=true}}
%or
\DocumentMetadata{debug={xmp-export=filename}}
%or
\SetKeys[document/metadata]{debug={xmp-export}}
```

By default the data are written to `\jobname.xmpi`, if a `filename` is given, then `filename.xmpi` is used instead. `xmp-export=false` deactivates the export.

2.2 Encoding and escaping

XMP-metadata are stored as UTF-8 in the PDF. This mean if you open a PDF in an editor a content like "grüße" will be shown probably as "grÃ¼ÃŸe". As XMP-metadata are in XML format special chars like <, >, and & and " must be escaped.

hyperxmp hooks into hyperref and passes all input through `\pdfstringdef`. This means a word like "hallo" is first converted by `\pdfstringdef` into `\376\377\000h\000a\000l\000l\000o` and then back to UTF-8 by hyperxmp and in the course of this action the XML-escapings are applied. pdfx uses `\pdfstringdef` together with a special fontencoding (similar to the PU-encoding of hyperref) for a similar aim. The code here is based on `\text_purify:n` followed by a few replacements for the escaping.

User data should normally be declared in the preamble (or even in the `\DocumentMetadata` command), and consist of rather simple text; `&` can be entered as `\&` (but directly `&` will normally work too), babel shorthands should not be used. Some data are interpreted as comma lists, in this cases commas which are part of the text should be protected by braces. In some cases a text in brackets like `[en]` is interpreted as language tag, if they are part of a text they should be protected by braces too. XMP-metadata are stored uncompressed in the PDF so if you are unsure if a value has been passed correctly, open the PDF in an editor, copy the whole block and pass it to a validator, e.g. https://www.w3.org/RDF/Validator/.

[4] hyperxmp was partly compatible as the pdfmanagement contained some patches for it, but these patches have now been removed.

[5] with a number of changes which are discussed in more details below

2.3 User interfaces and differences to hyperxmp

2.3.1 PDF standards

The hyperxmp/hyperref keys `pdfapart`, `pdfaconformance`, `pdfuapart`, `pdfxstandard` and `pdfa` are ignored by this code. Standards must be set with the `pdfstandard` key of `\DocumentMetadata` or `\SetKeys[document/metadata]`. This key can be used more than once, e.g.
`pdfstandard=A-2b,pdfstandard=X-4,pdfstandard=UA-1`.
Note that using these keys doesn't mean that the document actually follows the standard. LaTeX can neither ensure nor check all requirements of a standard, and not everything it can do theoretically has already been implemented. When setting an `A` standard, the code will e.g. insert a color profile and warn if the PDF version doesn't fit, but `X` and `UA` currently only adds the relevant declarations to the XMP-metadata. It is up to the author to ensure and validate that the document actually follows the standard.

2.3.2 Declarations

PDF knows beside standards also a more generic method to declare conformance to some specification by adding a declaration, see https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf). Such declarations can be added as a simple url which identify the specification or with additional details regarding date and credentials. An example would be

```
\RequirePackage{pdfmanagement} %or \DocumentMetadata{...}
\documentclass{article}
\ExplSyntaxOn
\pdfmeta_xmp_add_declaration:e {https://pdfa.org/declarations\c_hash_str iso32005}
\pdfmeta_xmp_add_declaration:ennnn
 {https://pdfa.org/declarations\c_hash_str wcag21A}{}{2023-11-20}{}{}
\pdfmeta_xmp_add_declaration:nnnnn
  {https://github.com/TikZlings/no-duck-harmed}
  {Ulrike~Fischer}{2023-11-20}{Bär}{https://github.com/u-fischer/bearwear}
\pdfmeta_xmp_add_declaration:nnnnn
 {https://github.com/TikZlings/no-duck-harmed}
 {Ulrike~Fischer}{2023-11-20}{Paulo}{https://github.com/cereda/sillypage}
\ExplSyntaxOff
\begin{document}
 text
\end{document}
```

2.3.3 Dates

- The dates `xmp:CreateDate`, `xmp:ModifyDate`, `xmp:MetadataDate` are normally set automatically to the current date/time when the compilation started. If they should be changed (e.g. for regression tests to produce reproducible documents) they can be set with `\hypersetup` with the keys `pdfcreationdate`, `pdfmoddate` and `pdfmetadate`.

  ```
  \hypersetup{pdfcreationdate=D:20010101205959-00'00'}
  ```

The format should be a full date/time in PDF format, so one of these (naturally the numbers can change):

```
D:20010101205959-00'00'
D:20010101205959+00'00'
D:200101012059592
```

- The date `dc:date` is an "author date" and so should normally be set to the same date as given by `\date`. This can be done with the key `pdfdate`[6]. The value should be a date in ISO 8601 format:

```
2022             %year
2022-09-04       %year-month-day
2022-09-04T19:20 %year-month-day hour:minutes
2022-09-04T19:20:30 % year-month-day hour:minutes:second
2022-09-04T19:20:30.45 % year-month-day hour:minutes:second with fraction
2022-09-04T19:20+01:00 % with time zone designator
2022-09-04T19:20-02:00 % time zone designator
2022-09-04T19:20Z      % time zone designator
```

  It is also possible to give the date as a full date in PDF format as described above. If not set the current date/time is used.

2.4 Language

The code assumes that a default language is always declared (as the pdfmanagement gives the `/Lang` entry in the catalog a default value) This language can be changed with the key `lang` of `\DocumentMetadata` and `\SetKeys[document/metadata]`. This is the preferred method. babel will look for this value and adjust its language settings. The hyperref key `pdflang` is also honored. Its value should be a simple language tag like `de` or `de-DE`.

The main language is also used in a number of attributes in the XMP data, if wanted a different language can be set here with the hyperref/hyperxmp key `pdfmetalang`.

A number of entries can be given a language tag. Such a language is given by using an "optional argument" before the text:

```
\hypersetup{pdftitle={[en]english,[de]deutsch}}
\hypersetup{pdfsubtitle={[en]subtitle in english}}
```

2.5 Rights

The keys `pdfcopyright` and `pdflicenseurl` work similar as in hyperxmp. But differently to hyperxmp the code doesn't set the `xmpRights:Marked` property, as I have some doubts that one deduce its value simply by checking if the other keys have been used; if needed it can be added by using one of these settings (true means with copyright, false means public domain).

```
\AddToDocumentProperties[document]{copyright}{true}
\AddToDocumentProperties[document]{copyright}{false}
```

[6] Extracting the value automatically from `\date` is not really possible as authors often put formatting or additional info in this command.

2.6 PDF related data

The PDF producer is for all engines by default built from the engine name and the engine version and doesn't use the banners as with hyperxmp and pdfx, it can be set manually with the `pdfproducer` key.

The key `pdftrapped` is ignored. `Trapped` is deprecated in PDF 2.0.

2.7 Document data

The authors should be given with the `pdfauthor` key, separated by commas. If an author contains a comma, protect/hide it by a brace.

2.8 User commands

The XMP-meta data are added automatically. This can be suppressed with the `document/metadata` key `xmp`.

`\pdfmeta_xmp_add:n` `\pdfmeta_xmp_add:n {⟨XML⟩}`

With this command additional XML code can be added to the Metadata. The content is added unchanged, and not sanitized.

`\pdfmeta_xmp_xmlns_new:nn` `\pdfmeta_xmp_xmlns_new:nn {⟨prefix⟩} {⟨uri⟩}`

With this command a xmlns name space can be added. The ⟨*uri*⟩ argument is expanded, a hash can be input with `\c_hash_str`.

With the two following commands PDF declarations can be added to the XMP metadata (see https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf).

`\pdfmeta_xmp_add_declaration:n` `\pdfmeta_xmp_add_declaration:n {⟨uri⟩}`
`\pdfmeta_xmp_add_declaration:e`

This add a PDF declaration with the required `conformsTo` property to the XMP metadata. ⟨*uri*⟩ should not be empty and is a URI specifying the standard or profile referred to by the PDF Declaration. If the uri contains a hash, use `\c_hash_str` to escape it and use the `e` variant to expand it.

`\pdfmeta_xmp_add_declaration:nnnnn` `\pdfmeta_xmp_add_declaration:nnnnn`
`\pdfmeta_xmp_add_declaration:(ennnn|eeenn)` `{⟨uri⟩} {⟨By⟩} {⟨Date⟩} {⟨Credentials⟩} {⟨Report⟩}`

This add a PDF declaration to the XMP metadata similar to `\pdfmeta_xmp_add_declaration:n`. With ⟨*By*⟩, ⟨*Date*⟩, ⟨*Credentials*⟩, ⟨*Report*⟩ the optional fields `claimBy` (text), `claimDate` (iso date), `claimCredentials` (text) and `claimReport` (uri) of the `claimData` property can be given. If `\pdfmeta_xmp_add_declaration:nnnnn` is used twice with the same ⟨*uri*⟩ argument the `claimData` are concatenated. There is no check if the `claimData` are identical.

The following two commands can be used to extend the schema declarations in the XMP metadata. This is for example needed to implement a standard like ZUGferd/Factur X for invoices. A schema declaration should be added only once but as this task is probably not needed frequently only light guards are there to avoid duplicated entries.

\pdfmeta_xmp_schema_new:nnn `\pdfmeta_xmp_schema_new:nnn {⟨text⟩} {⟨prefix⟩} {⟨uri⟩}`

⟨*text*⟩ is some string describing the schema, e.g. `PDF/A~Identification~Schema`, ⟨*prefix*⟩ is the unique prefix used by the schema. This prefix must be declared first with `\pdfmeta_xmp_xmlns_new:nn`. If a schema with this prefix has already been declared, it will currently be ignored with a warning. The ⟨*uri*⟩ is expanded, so a hash can for example be given as `\c_hash_str`.

\pdfmeta_xmp_property_new:nnnnn `\pdfmeta_xmp_property_new:nnnnn {⟨schema prefix⟩} {⟨name⟩} {⟨type⟩} {⟨category⟩} {⟨description⟩}`

If the new property already exists in the schema (as identified by the combination of ⟨*schema prefix*⟩ and ⟨*name*⟩ the property is silently ignore. ⟨*schema prefix*⟩ is the prefix declared with the previous command. schema, e.g. `PDF/A~Identification~Schema`, ⟨*name*⟩ is a short string that identifies the property, e.g. `xmpMM` or `year`. It must be unique in the properties of a schema. ⟨*type*⟩ is e.g. `URI` or `Integer` or `Text`, ⟨*category*⟩ is e.g. `internal` or `external`, ⟨*description*⟩ is a free description string.

(*End of definition for* `\l__pdfmeta_tmpa_tl` *and others.*)

3.1 Standards (work in progress)

3.1.1 Tools and tests

These internal properties will contain the active settings for a standard family. `\g__pdfmeta_standard_prop` will be used to contain the requirements of the current family for a validation.

`\g__pdfmeta_standard_prop`
`\g__pdfmeta_standard_A_prop`
`\g__pdfmeta_standard_UA_prop`
`\g__pdfmeta_standard_X_prop`

```
\prop_new:N \g__pdfmeta_standard_prop
\prop_new:N \g__pdfmeta_standard_A_prop
\prop_new:N \g__pdfmeta_standard_UA_prop
\prop_new:N \g__pdfmeta_standard_X_prop
```

(*End of definition for* `\g__pdfmeta_standard_prop` *and others.*)

3.1.2 Functions to check a requirement

`\pdfmeta_standard_family:nn`

This allows to run tests for another standard family: it switches the requirements, executes the code stored in the second argument and then switches back.

```
\cs_new_protected:Npn \pdfmeta_standard_family:nn #1 #2
 {
   \prop_if_exist:cTF { g__pdfmeta_standard_#1_prop }
    {
```

until documentmetadata-support is update we can not be sure that the A prop is properly filled.

```
      \prop_gset_eq:NN \g__pdfmeta_standard_A_prop \g__pdfmeta_standard_prop
      \prop_gset_eq:Nc \g__pdfmeta_standard_prop { g__pdfmeta_standard_#1_prop }
       #2
      \prop_gset_eq:NN \g__pdfmeta_standard_prop \g__pdfmeta_standard_A_prop
    }
    {
      \msg_warning:nnn {pdf} {unknown-standard-family}{#1}
    }
 }
```

(*End of definition for* `\pdfmeta_standard_family:nn`. *This function is documented on page 2.*)

At first two commands to get the standard value if needed:

`\pdfmeta_standard_item:n`

```
\cs_new:Npn \pdfmeta_standard_item:n #1
 {
   \prop_item:Nn \g__pdfmeta_standard_prop {#1}
 }
```

(*End of definition for* `\pdfmeta_standard_item:n`. *This function is documented on page 2.*)

`\pdfmeta_standard_get:nN`

```
\cs_new_protected:Npn \pdfmeta_standard_get:nN #1 #2
 {
   \prop_get:NnN \g__pdfmeta_standard_prop {#1} #2
 }
```

(*End of definition for* `\pdfmeta_standard_get:nN`. *This function is documented on page* 3.)

Now two functions to check the requirement. A simple and one value/handler based.

`\pdfmeta_standard_verify_p:n`
`\pdfmeta_standard_verify:nTF`

This is a simple test is the requirement is in the prop.

```
\prg_new_conditional:Npnn \pdfmeta_standard_verify:n #1 {T,F,TF}
  {
     \prop_if_in:NnTF \g__pdfmeta_standard_prop {#1}
       {
         \prg_return_false:
       }
       {
         \prg_return_true:
       }
  }
```

(*End of definition for* `\pdfmeta_standard_verify:nTF`. *This function is documented on page* 2.)

`\pdfmeta_standard_verify:nnTF`

This allows to test against a user value. It calls a test handler if this exists and passes the user and the standard value to it. The test handler should return true or false.

```
\prg_new_protected_conditional:Npnn \pdfmeta_standard_verify:nn #1 #2  {T,F,TF}
  {
    \prop_if_in:NnTF \g__pdfmeta_standard_prop {#1}
      {
        \cs_if_exist:cTF {__pdfmeta_standard_verify_handler_#1:nn}
          {
            \exp_args:Nnne
            \use:c
              {__pdfmeta_standard_verify_handler_#1:nn}
              { #2 }
              { \prop_item:Nn \g__pdfmeta_standard_prop {#1} }
          }
          {
            \prg_return_false:
          }
      }
      {
        \prg_return_true:
      }
   }
```

(*End of definition for* `\pdfmeta_standard_verify:nnTF`. *This function is documented on page* 2.)

Now we setup a number of handlers.

The first actually ignores the user values and tests against the current pdf version. If this is smaller than the minimum we report a failure. `#1` is the user value, `#2` the reference value from the standard.

`_standard_verify_handler_min_pdf_version:nn`

```
%
\cs_new_protected:Npn \__pdfmeta_standard_verify_handler_min_pdf_version:nn #1 #2
 {
   \pdf_version_compare:NnTF <
     { #2 }
     {\prg_return_false:}
```

```
      {\prg_return_true:}
  }
```

(*End of definition for* `\__pdfmeta_standard_verify_handler_min_pdf_version:nn`.)

The next is the counter part and checks that the version is not to high

_standard_verify_handler_max_pdf_version:nn

```
%
\cs_new_protected:Npn \__pdfmeta_standard_verify_handler_max_pdf_version:nn #1 #2
 {
   \pdf_version_compare:NnTF >
     { #2 }
     {\prg_return_false:}
     {\prg_return_true:}
 }
```

(*End of definition for* `\__pdfmeta_standard_verify_handler_max_pdf_version:nn`.)

The next checks if the user value is in the list and returns a failure if not.

ta_standard_verify_handler_named_actions:nn

```
\cs_new_protected:Npn \__pdfmeta_standard_verify_handler_named_actions:nn #1 #2
 {
   \tl_if_in:nnTF { #2 }{ #1 }
     {\prg_return_true:}
     {\prg_return_false:}
 }
```

(*End of definition for* `\__pdfmeta_standard_verify_handler_named_actions:nn`.)

The next checks if the user value is in the list and returns a failure if not.

a_standard_verify_handler_annot_action_A:nn

```
\cs_new_protected:Npn \__pdfmeta_standard_verify_handler_annot_action_A:nn #1 #2
 {
   \tl_if_in:nnTF { #2 }{ #1 }
     {\prg_return_true:}
     {\prg_return_false:}
 }
```

(*End of definition for* `\__pdfmeta_standard_verify_handler_annot_action_A:nn`.)

This check is probably not needed, but for completeness

dard_verify_handler_outputintent_subtype:nn

```
\cs_new_protected:Npn \__pdfmeta_standard_verify_handler_outputintent_subtype:nn #1 #2
 {
   \tl_if_eq:nnTF { #2 }{ #1 }
     {\prg_return_true:}
     {\prg_return_false:}
 }
```

(*End of definition for* `\__pdfmeta_standard_verify_handler_outputintent_subtype:nn`.)

3.1.3 Enforcing requirements

A number of requirements can sensibly be enforced by us.

Annot flags pdf/A require a number of settings here, we store them in a command which can be added to the property of the standard:

```
\cs_new_protected:Npn \__pdfmeta_verify_pdfa_annot_flags:
  {
    \bitset_set_true:Nn  \l_pdfannot_F_bitset {Print}
    \bitset_set_false:Nn \l_pdfannot_F_bitset {Hidden}
    \bitset_set_false:Nn \l_pdfannot_F_bitset {Invisible}
    \bitset_set_false:Nn \l_pdfannot_F_bitset {NoView}
    \pdfannot_dict_put:nnn {link/URI}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
    \pdfannot_dict_put:nnn {link/GoTo}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
    \pdfannot_dict_put:nnn {link/GoToR}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
    \pdfannot_dict_put:nnn {link/Launch}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
    \pdfannot_dict_put:nnn {link/Named}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
  }
```

At begin document this should be checked:

```
\hook_gput_code:nnn {begindocument} {pdf}
  {
    \pdfmeta_standard_verify:nF { annot_flags }
     { \__pdfmeta_verify_pdfa_annot_flags: }
    \pdfmeta_standard_verify:nF { Trailer_no_Info }
     { \__pdf_backend_omit_info:n {1} }
    \pdfmeta_standard_verify:nF { no_CharSet }
     { \__pdf_backend_omit_charset:n {1} }
    \pdfmeta_standard_verify:nF { omit_CID }
     { \__pdf_backend_omit_cidset:n {1} }
    \__pdfmeta_check_standard_pdfversion:
  }
```

3.1.4 pdf/A

We use global properties so that follow up standards can be copied and then adjusted. Some note about requirements for more standard can be found in info/pdfstandard.tex.

\g__pdfmeta_standard_pdf/A-1B_prop
\g__pdfmeta_standard_pdf/A-2A_prop
\g__pdfmeta_standard_pdf/A-2B_prop
\g__pdfmeta_standard_pdf/A-2U_prop
\g__pdfmeta_standard_pdf/A-3A_prop
\g__pdfmeta_standard_pdf/A-3B_prop
\g__pdfmeta_standard_pdf/A-3U_prop
\g__pdfmeta_standard_pdf/A-4_prop
\g__pdfmeta_standard_pdf/A-4F_prop
\g__pdfmeta_standard_pdf/A-4E_prop

```
\prop_new:c { g__pdfmeta_standard_pdf/A-1B_prop }

  }
```

(*End of definition for* `\g__pdfmeta_standard_pdf/X-4_prop` *and others.*)

3.1.7 Embedded Files

Standard 4-AF is needed if we add AF files for tagging but it also requires an EmbeddedFiles name tree, so we test at the end if the name tree is empty and add a small readme if yes

```
\AddToHook{begindocument/end}
{
  \pdfmeta_standard_verify:nF{Catalog_EmbeddedFiles}
   {

}
```

3.1.8 Colorprofiles and Outputintents

The following provides a minimum of interface to add a color profile and an outputintent need for PDF/A for now. There will be need to extend it later, so we try for enough generality.

Adding a profile and an intent is technically easy:

1. Embed the profile as stream with

   ```
   \pdf_object_unnamed_write:nn{fstream} {{/N~4}{XXX.icc}}
   ```

2. Write a `/OutputIntent` dictionary for this

   ```
   \pdf_object_unnamed_write:ne {dict}
    {
      /Type /OutputIntent
      /S /GTS_PDFA1  % or GTS_PDFX or ISO_PDFE1 or ...
      /DestOutputProfile \pdf_object_ref_last: % ref the color profile
      /OutputConditionIdentifier ...
      ... %more info
    }
   ```

3. Reference the dictionary in the catalog:

   ```
   \pdfmanagement_add:nne {Catalog}{OutputIntents}{\pdf_object_ref_last:}
   ```

But we need to do a bit more work, to get the interface right. The object for the profile should be named, to allow l3color to reuse it if needed. And we need container to store the profiles, to handle the standard requirements.

`\g__pdfmeta_outputintents_prop` This variable will hold the profiles for the subtypes. We assume that every subtype has only only color profile.

```
\prop_new:N \g__pdfmeta_outputintents_prop
```

(*End of definition for* `\g__pdfmeta_outputintents_prop`.)

Some keys to fill the property.

```
\keys_define:nn { document / metadata }
  {
    colorprofiles .code:n =
     {
       \keys_set:nn { document / metadata / colorprofiles }{#1}
     }
  }
\keys_define:nn { document / metadata / colorprofiles }
 {
   ,A .code:n =
```

```
      {
        \tl_if_blank:nF {#1}
          {
            \prop_gput:Nnn \g__pdfmeta_outputintents_prop
             { GTS_PDFA1  } {#1}
          }
      }
   ,a .code:n =
      {
        \tl_if_blank:nF {#1}
          {
            \prop_gput:Nnn \g__pdfmeta_outputintents_prop
              { GTS_PDFA1  } {#1}
          }
      }
   ,X .code:n =
      {
        \tl_if_blank:nF {#1}
          {
             \prop_gput:Nnn \g__pdfmeta_outputintents_prop
              { GTS_PDFX  } {#1}
          }
      }
   ,x .code:n =
      {
        \tl_if_blank:nF {#1}
          {
            \prop_gput:Nnn \g__pdfmeta_outputintents_prop
              { GTS_PDFX  } {#1}
          }
      }
   ,unknown .code:n =
     {
       \tl_if_blank:nF {#1}
          {
           \exp_args:NNo
            \prop_gput:Nnn \g__pdfmeta_outputintents_prop
              { \l_keys_key_str  } {#1}
          }
     }
 }
```

At first we setup our two default profiles. This is internal as the public interface is still undecided.

```
\pdfdict_new:n   {l_pdfmeta/outputintent}
\pdfdict_put:nnn {l_pdfmeta/outputintent}
  {Type}{/OutputIntent}
\prop_const_from_keyval:cn { c__pdfmeta_colorprofile_sRGB.icc}
  {
    ,OutputConditionIdentifier=IEC~sRGB
    ,Info=IEC~61966-2.1~Default~RGB~colour~space~-~sRGB
    ,RegistryName=http://www.iec.ch
    ,N = 3
  }
```

```
\prop_const_from_keyval:cn { c__pdfmeta_colorprofile_FOGRA39L_coated.icc}
  {
    ,OutputConditionIdentifier=FOGRA39L~Coated
    ,Info={Offset~printing,~according~to~ISO~12647-2:2004/Amd~1,~OFCOM,~ %
           paper~type~1~or~2~=~coated~art,~115~g/m2,~tone~value~increase~
           curves~A~(CMY)~and~B~(K)}
    ,RegistryName=http://www.fogra.org
    ,N = 4
  }
```

__pdfmeta_embed_colorprofile:n
__pdfmeta_write_outputintent:nn

The commands embed the profile, and write the dictionary and add it to the catalog. The first command should perhaps be moved to l3color as it needs such profiles too. We used named objects so that we can check if the profile is already there. This is not foolproof if paths are used.

```
\cs_new_protected:Npn \__pdfmeta_embed_colorprofile:n #1%#1 file name
  {
    \pdf_object_if_exist:nF { __color_icc_ #1 }
      {
        \pdf_object_new:n  { __color_icc_ #1 }
        \pdf_object_write:nne { __color_icc_ #1 } { fstream }
         {
           {/N\c_space_tl
             \prop_item:cn{c__pdfmeta_colorprofile_#1}{N}
           }
           {#1}
         }
      }
  }

\cs_new_protected:Npn \__pdfmeta_write_outputintent:nn #1 #2 %#1 file name, #2 subtype
  {
    \group_begin:
     \pdfdict_put:nne {l_pdfmeta/outputintent}{S}{/\str_convert_pdfname:n{#2}}
     \pdfdict_put:nne {l_pdfmeta/outputintent}
       {DestOutputProfile}
       {\pdf_object_ref:n{ __color_icc_ #1 }}
     \clist_map_inline:nn { OutputConditionIdentifier, Info, RegistryName }
       {
         \prop_get:cnNT
          { c__pdfmeta_colorprofile_#1}
          { ##1 }
          \l__pdfmeta_tmpa_tl
          {
            \pdf_string_from_unicode:nVN {utf8/string}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpa_st
            \pdfdict_put:nne
              {l_pdfmeta/outputintent}{##1}{\l__pdfmeta_tmpa_str}
          }
       }
     \pdf_object_unnamed_write:ne {dict}{\pdfdict_use:n {l_pdfmeta/outputintent} }
     \pdfmanagement_add:nne {Catalog}{OutputIntents}{\pdf_object_ref_last:}
    \group_end:
  }
```

(*End of definition for* `\__pdfmeta_embed_colorprofile:n` *and* `\__pdfmeta_write_outputintent:nn`.)

Now the verifying code. If no requirement is set we simply loop over the property

```
\AddToHook{begindocument/end}
 {
   \pdfmeta_standard_verify:nTF {outputintent_A}
    {
      \prop_map_inline:Nn \g__pdfmeta_outputintents_prop
         {
           \prop_if_exist:cTF {c__pdfmeta_colorprofile_#2}
             {
               \__pdfmeta_embed_colorprofile:n
                {#2}
               \__pdfmeta_write_outputintent:nn
                {#2}
                {#1}
             }
             {
              \msg_warning:nnn{pdfmeta}{colorprofile-undefined}{#2}
             }
         }
    }
```

If an output intent is required for pdf/A we need to ensure, that the key of default subtype has a value, as default we take sRGB.icc. Then we loop but take always the same profile.

```
    {
       \exp_args:NNe
       \prop_if_in:NnF
         \g__pdfmeta_outputintents_prop
         { \pdfmeta_standard_item:n { outputintent_A } }
         {
           \exp_args:NNe
           \prop_gput:Nnn
             \g__pdfmeta_outputintents_prop
             { \pdfmeta_standard_item:n { outputintent_A } }
             { sRGB.icc }
         }
       \exp_args:NNe
       \prop_get:NnN
         \g__pdfmeta_outputintents_prop
         { \pdfmeta_standard_item:n { outputintent_A } }
         \l__pdfmeta_tmpb_tl
       \prop_if_exist:cTF {c__pdfmeta_colorprofile_\l__pdfmeta_tmpb_tl}
        {
          \exp_args:NV \__pdfmeta_embed_colorprofile:n \l__pdfmeta_tmpb_tl
          \prop_map_inline:Nn \g__pdfmeta_outputintents_prop
            {
              \exp_args:NV
               \__pdfmeta_write_outputintent:nn
                 \l__pdfmeta_tmpb_tl
                 { #1 }
            }
        }
        {
          \msg_warning:nne{pdfmeta}{colorprofile-undefined}{\l__pdfmeta_tmpb_tl}
```

```
620           }
621         }
622     }
```

3.2 Regression test

This is simply a copy of the backend function.

```
623 \cs_new_protected:Npn \pdfmeta_set_regression_data:
624   { \__pdf_backend_set_regression_data: }
```

4 XMP-Metadata implementation

\g__pdfmeta_xmp_bool This boolean decides if the metadata are included

```
625 \bool_new:N\g__pdfmeta_xmp_bool
626 \bool_gset_true:N \g__pdfmeta_xmp_bool
```

(*End of definition for* \g__pdfmeta_xmp_bool.)

Preset the two fields to avoid problems with standards.

```
627 \hook_gput_code:nnn{pdfmanagement/add}{pdfmanagement}
628   {
629     \pdfmanagement_add:nne {Info}{Producer}{(\c_sys_engine_exec_str-\c_sys_engine_version_str
630     \pdfmanagement_add:nne {Info}{Creator}{(LaTeX)}
631   }
```

4.1 New document keys

```
632 \cs_generate_variant:Nn\pdf_version_gset:n{e}
```

if the pdf version is wrong for the standard we force the highest possible.

```
633 \cs_new_protected:Nn\__pdfmeta_force_standard_pdfversion:
634  {
635    \pdfmeta_standard_verify:nnF { min_pdf_version }
636     { \pdf_version: }
637     {
638       \pdfmeta_standard_verify:nTF { max_pdf_version }
639        {
640          \pdf_version_gset:n { 2.0 }
641        }
642        {
643          \pdf_version_gset:e{ \pdfmeta_standard_item:n{ max_pdf_version } }
644        }
645     }
646   \pdfmeta_standard_verify:nnF { max_pdf_version }
647     { \pdf_version: }
648     {
649       \pdf_version_gset:e{ \pdfmeta_standard_item:n{ max_pdf_version } }
650     }
651  }
```

At begin document we then want to test if there is a version problem.

```
\cs_new_protected:Npn \__pdfmeta_check_standard_pdfversion:
 {
   \clist_map_inline:nn{A,UA,X}
    {
     \pdfmeta_standard_family:nn { ##1 }

4.3 Some helper commands

4.3.1 Generate a BOM

__pdfmeta_xmp_generate_bom:

```
\bool_lazy_or:nnTF
  { \sys_if_engine_luatex_p: }
  { \sys_if_engine_xetex_p: }
  {
    \cs_new:Npn \__pdfmeta_xmp_generate_bom:
      { \char_generate:nn {"FEFF}{12} }
  }
  {
    \cs_new:Npn \__pdfmeta_xmp_generate_bom:
      {
        \char_generate:nn {"EF}{12}
        \char_generate:nn {"BB}{12}
        \char_generate:nn {"BF}{12}
      }
  }
```

(*End of definition for* __pdfmeta_xmp_generate_bom:.)

4.3.2 Indentation

We provide a command which indents the xml based on a counter, and one which accepts a fix number. The counter can be increased and decreased.

\l__pdfmeta_xmp_indent_int

```
\int_new:N  \l__pdfmeta_xmp_indent_int
```

(*End of definition for* `\l__pdfmeta_xmp_indent_int`.)

__pdfmeta_xmp_indent:
__pdfmeta_xmp_indent:n
__pdfmeta_xmp_incr_indent:
__pdfmeta_xmp_decr_indent:

```
\cs_new:Npn \__pdfmeta_xmp_indent:
  {
    \iow_newline:
    \prg_replicate:nn {\l__pdfmeta_xmp_indent_int}{\c_space_tl}
  }

\cs_new:Npn \__pdfmeta_xmp_indent:n #1
  {
    \iow_newline:
    \prg_replicate:nn {#1}{\c_space_tl}
  }

\cs_new_protected:Npn \__pdfmeta_xmp_incr_indent:
  {
    \int_incr:N \l__pdfmeta_xmp_indent_int
  }

\cs_new_protected:Npn \__pdfmeta_xmp_decr_indent:
  {
    \int_decr:N \l__pdfmeta_xmp_indent_int
  }
```

(*End of definition for* `\__pdfmeta_xmp_indent:` *and others.*)

4.3.3 Date and time handling

If the date is given in PDF format we have to split it to create the XMP format. We use a precompiled regex for this. To some extend the regex can also handle incomplete dates.

\l__pdfmeta_xmp_date_regex

```
\regex_new:N \l__pdfmeta_xmp_date_regex
\regex_set:Nn \l__pdfmeta_xmp_date_regex
 {D:(\d{4})(\d{2})(\d{2})(\d{2})?(\d{2})?(\d{2})?([Z\+\-])?(?:(\d{2})\')?(?:(\d{2})\')?}
```

(*End of definition for* `\l__pdfmeta_xmp_date_regex`.)

__pdfmeta_xmp_date_split:nN

This command takes a date in PDF format, splits it with the regex and stores the captures in a sequence.

```
\cs_new_protected:Npn \__pdfmeta_xmp_date_split:nN #1 #2 %#1 date, #2 seq
  {
    \regex_split:NnN \l__pdfmeta_xmp_date_regex {#1} #2
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_date_split:nN {VN,eN}
```

(*End of definition for* `\__pdfmeta_xmp_date_split:nN`.)

`\__pdfmeta_xmp_print_date:N` This prints the date stored in a sequence as created by the previous command.

```
\cs_new:Npn\__pdfmeta_xmp_print_date:N #1 % seq
  {
    \tl_if_blank:eTF { \seq_item:Nn #1 {1} }
     {
       \seq_item:Nn #1 {2} %year
        -
       \seq_item:Nn #1 {3} %month
        -
       \seq_item:Nn #1 {4} % day
       \tl_if_blank:eF
         { \seq_item:Nn #1 {5} }
         { T \seq_item:Nn #1 {5} } %hour
       \tl_if_blank:eF
         { \seq_item:Nn #1 {6} }
         { : \seq_item:Nn #1 {6} } %minutes
       \tl_if_blank:eF
         { \seq_item:Nn #1 {7} }
         { : \seq_item:Nn #1 {7} } %seconds
       \seq_item:Nn #1 {8}  %Z,+,-
       \seq_item:Nn #1 {9}
       \tl_if_blank:eF
         { \seq_item:Nn #1 {10} }
         { : \seq_item:Nn #1 {10} }
      }
      {
        \seq_item:Nn #1 {1}
      }
  }
```

(*End of definition for* `\__pdfmeta_xmp_print_date:N`.)

`\l__pdfmeta_xmp_currentdate_tl` The tl var contains the date of the log-file in PDF format, the seq the result split with
`\l__pdfmeta_xmp_currentdate_seq` the regex.

```
\tl_new:N  \l__pdfmeta_xmp_currentdate_tl
\seq_new:N \l__pdfmeta_xmp_currentdate_seq
```

(*End of definition for* `\l__pdfmeta_xmp_currentdate_tl` *and* `\l__pdfmeta_xmp_currentdate_seq`.)

`\__pdfmeta_xmp_date_get:nNN` This checks a document property and if empty uses the current date.

```
\cs_new_protected:Npn \__pdfmeta_xmp_date_get:nNN #1 #2 #3
  %#1 property, #2 tl var with PDF date, #3 seq for split date
  {
    \tl_set:Ne #2 { \pdfmanagement_get_documentproperty:n{#1} }
    \tl_if_blank:VTF #2
      {
        \seq_set_eq:NN #3 \l__pdfmeta_xmp_currentdate_seq
        \tl_set_eq:NN  #2 \l__pdfmeta_xmp_currentdate_tl
      }
      {
        \__pdfmeta_xmp_date_split:VN #2 #3
      }
  }
```

(*End of definition for* `\__pdfmeta_xmp_date_get:nNN`.)

4.3.4 UUID

We need a command to generate an uuid

__pdfmeta_xmp_create_uuid:nN

```
\cs_new_protected:Npn \__pdfmeta_xmp_create_uuid:nN #1 #2
  {
    \str_set:Ne#2 {\str_lowercase:f{\tex_mdfivesum:D{#1}}}
    \str_set:Ne#2
      { uuid:
        \str_range:Nnn #2{1}{8}
        -\str_range:Nnn#2{9}{12}
        -4\str_range:Nnn#2{13}{15}
        -8\str_range:Nnn#2{16}{18}
        -\str_range:Nnn#2{19}{30}
      }
  }
```

(*End of definition for* `\__pdfmeta_xmp_create_uuid:nN`.)

4.3.5 Purifying and escaping of strings

__pdfmeta_xmp_sanitize:nN

We have to sanitize the user input. For this we pass it through `\text_purify` and then replace a few special chars.

```
\cs_new_protected:Npn \__pdfmeta_xmp_sanitize:nN #1 #2
%#1 input string, #2 str with the output
  {
    \group_begin:
     \text_declare_purify_equivalent:Nn \& {\tl_to_str:N & }
     \text_declare_purify_equivalent:Nn \texttilde {\c_tilde_str}
     \tl_set:Ne \l__pdfmeta_tmpa_tl { \text_purify:n {#1} }
     \str_gset:Ne \g__pdfmeta_tmpa_str { \tl_to_str:N \l__pdfmeta_tmpa_tl }
     \str_greplace_all:Nnn\g__pdfmeta_tmpa_str {&}{&amp;}
     \str_greplace_all:Nnn\g__pdfmeta_tmpa_str {<}{&lt;}
     \str_greplace_all:Nnn\g__pdfmeta_tmpa_str {>}{&gt;}
     \str_greplace_all:Nnn\g__pdfmeta_tmpa_str {"}{&quot;}
    \group_end:
     \str_set_eq:NN #2 \g__pdfmeta_tmpa_str
  }

\cs_generate_variant:Nn\__pdfmeta_xmp_sanitize:nN {VN}
```

(*End of definition for* `\__pdfmeta_xmp_sanitize:nN`.)

4.4 Language handling

The language of the metadata is used in various attributes, so we store it in command.

\l__pdfmeta_xmp_doclang_tl
\l__pdfmeta_xmp_metalang_tl

```
\tl_new:N \l__pdfmeta_xmp_doclang_tl
\tl_new:N \l__pdfmeta_xmp_metalang_tl
```

(*End of definition for* `\l__pdfmeta_xmp_doclang_tl` *and* `\l__pdfmeta_xmp_metalang_tl`.)

The language is retrieved at the start of the packet. We assume that `lang` is always set and so don't use the `x-default` value of hyperxmp.

\l__pdfmeta_xmp_lang_regex

```
\regex_new:N\l__pdfmeta_xmp_lang_regex
\regex_set:Nn\l__pdfmeta_xmp_lang_regex {\A\[([A-Za-z\-]+)\](.*)}
```

(*End of definition for* `\l__pdfmeta_xmp_lang_regex`.)

```
\cs_new_protected:Npn \__pdfmeta_xmp_lang_get:nNN #1 #2 #3
% #1 text, #2 tl var for lang match (or default), #3 tl var for text
  {
    \regex_extract_once:NnN \l__pdfmeta_xmp_lang_regex {#1}\l__pdfmeta_tmpa_seq
    \seq_if_empty:NTF \l__pdfmeta_tmpa_seq
      {
        \tl_set:Nn #2 \l__pdfmeta_xmp_metalang_tl
        \tl_set:Nn #3 {#1}
      }
      {
        \tl_set:Ne #2 {\seq_item:Nn\l__pdfmeta_tmpa_seq{2}}
        \tl_set:Ne #3 {\seq_item:Nn\l__pdfmeta_tmpa_seq{3}}
      }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_lang_get:nNN {eNN,VNN}
```

4.5 Filling the packet

This tl var that holds the whole packet

\g__pdfmeta_xmp_packet_tl

```
\tl_new:N \g__pdfmeta_xmp_packet_tl
```

(*End of definition for* `\g__pdfmeta_xmp_packet_tl`.)

4.5.1 Helper commands to add lines and lists

__pdfmeta_xmp_add_packet_chunk:n

This is the most basic command. It is meant to produce a line and will use the current indent.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_chunk:n #1
  {
    \tl_gput_right:Ne\g__pdfmeta_xmp_packet_tl
      {
        \__pdfmeta_xmp_indent:  \exp_not:n{#1}
      }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_chunk:n {e}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_chunk:n`.)

__pdfmeta_xmp_add_packet_chunk:nN

This is the most basic command. It is meant to produce a line and will use the current indent.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_chunk:nN #1 #2
  {
    \tl_put_right:Ne#2
      {
        \__pdfmeta_xmp_indent:  \exp_not:n{#1}
      }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_chunk:nN {eN}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_chunk:nN`.)

`\__pdfmeta_xmp_add_packet_open:nn` This commands opens a xml structure and increases the indent.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_open:nn #1 #2 %#1 prefix #2 name
  {
    \__pdfmeta_xmp_add_packet_chunk:n {<#1:#2>}
    \__pdfmeta_xmp_incr_indent:
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_open:nn  {ne}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_open:nn`.)

`\__pdfmeta_xmp_add_packet_open_attr:nnn` This commands opens a xml structure too but allows also to give an attribute.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_open_attr:nnn #1 #2 #3
  %#1 prefix #2 name #3 attr
  {
    \__pdfmeta_xmp_add_packet_chunk:n {<#1:#2~#3>}
    \__pdfmeta_xmp_incr_indent:
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_open_attr:nnn  {nne}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_open_attr:nnn`.)

`\__pdfmeta_xmp_add_packet_close:nn` This closes a structure and decreases the indent.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_close:nn #1 #2 %#1 prefix #2:name
  {
    \__pdfmeta_xmp_decr_indent:
    \__pdfmeta_xmp_add_packet_chunk:n {</#1:#2>}
  }
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_close:nn`.)

`\__pdfmeta_xmp_add_packet_line:nnn` This will produce a full line with open and closing xml. The content is sanitized. We test if there is content to be able to suppress data which has not be set.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_line:nnn #1 #2 #3
 %#1 prefix #2 name #3 content
  {
    \tl_if_blank:nF {#3}
     {
      \__pdfmeta_xmp_sanitize:nN {#3}\l__pdfmeta_tmpa_str
      \__pdfmeta_xmp_add_packet_chunk:e {<#1:#2>\l__pdfmeta_tmpa_str</#1:#2>}
     }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_line:nnn {nne,nnV,nee}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_line:nnn`.)

`\__pdfmeta_xmp_add_packet_line:nnnN` This will produce a full line with open and closing xml and store it in the given tl-var. This allows to prebuild blocks and then to test if there are empty. The content is sanitized. We test if there is content to be able to suppress data which has not be set.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_line:nnnN #1 #2 #3 #4
 %#1 prefix #2 name #3 content #4 tl_var to prebuilt.
  {
    \tl_if_blank:nF {#3}
     {
```

```
      \__pdfmeta_xmp_sanitize:nN {#3}\l__pdfmeta_tmpa_str
      \__pdfmeta_xmp_add_packet_chunk:eN {<#1:#2>\l__pdfmeta_tmpa_str</#1:#2>} #4
    }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_line:nnnN {nneN}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_line:nnnN`.)

`\__pdfmeta_xmp_add_packet_line_attr:nnnn` A similar command with attribute

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_line_attr:nnnn #1 #2 #3 #4
 %#1 prefix #2 name #3 attribute #4 content
  {
    \tl_if_blank:nF {#4}
     {
      \__pdfmeta_xmp_sanitize:nN {#4}\l__pdfmeta_tmpa_str
      \__pdfmeta_xmp_add_packet_chunk:e {<#1:#2~#3>\l__pdfmeta_tmpa_str</#1:#2>}
     }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_line_attr:nnnn {nnee,nneV}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_line_attr:nnnn`.)

`\__pdfmeta_xmp_add_packet_line_default:nnnn`

```
 \cs_new_protected:Npn \__pdfmeta_xmp_add_packet_line_default:nnnn #1 #2 #3 #4
   % #1 prefix #2 name #3 default #4 content
   {
     \tl_if_blank:nTF { #4 }
      {
       \tl_set:Nn  \l__pdfmeta_tmpa_tl  {#3}
      }
      {
        \tl_set:Nn \l__pdfmeta_tmpa_tl  {#4}
      }
     \__pdfmeta_xmp_add_packet_line:nnV {#1}{#2}\l__pdfmeta_tmpa_tl
   }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_line_default:nnnn {nnee}
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_line_default:nnnn`.)

Some data are stored as unordered (Bag) or ordered lists (Seq) or (Alt). The first variant are for simple text without language support:

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_list_simple:nnnn #1 #2 #3 #4
  %#1 prefix, #2 name,  #3 type (Seq/Bag/Alt) #4 a clist
  {
    \clist_if_empty:nF { #4 }
      {
        \__pdfmeta_xmp_add_packet_open:nn {#1}{#2}
         \__pdfmeta_xmp_add_packet_open:nn {rdf}{#3}
          \clist_map_inline:nn {#4}
            {
              \__pdfmeta_xmp_add_packet_line:nnn
               {rdf}{li}{##1}
            }
         \__pdfmeta_xmp_add_packet_close:nn{rdf}{#3}
        \__pdfmeta_xmp_add_packet_close:nn {#1}{#2}
```

```
    }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_list_simple:nnnn {nnnV,nnne}
```

Here we check also for the language.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_list:nnnn #1 #2 #3 #4
  %#1 prefix, #2 name,  #3 type (Seq/Bag/Alt) #4 a clist
  {
    \clist_if_empty:nF { #4 }
      {
        \__pdfmeta_xmp_add_packet_open:nn {#1}{#2}
         \__pdfmeta_xmp_add_packet_open:nn {rdf}{#3}
          \clist_map_inline:nn {#4}
            {
              \__pdfmeta_xmp_lang_get:nNN {##1}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpb_tl
```

change 2024-02-22. There should be if possible a x-default entry as some viewers need that. So if the language is equal to the main language we use that. This assumes that the user hasn't marked every entry as some other language! x-default has to be the first entry, see issue #92, so we have to go through the list twice.

```
               \tl_if_eq:eeT{\l__pdfmeta_tmpa_tl}{\l__pdfmeta_xmp_metalang_tl}
                 {
                   \__pdfmeta_xmp_add_packet_line_attr:nneV
                    {rdf}{li}{xml:lang="x-default" }\l__pdfmeta_tmpb_tl
                   \__pdfmeta_xmp_add_packet_line_attr:nneV
                    {rdf}{li}{xml:lang="\l__pdfmeta_tmpa_tl" }\l__pdfmeta_tmpb_tl
                 }
             }
           \clist_map_inline:nn {#4}
             {
               \__pdfmeta_xmp_lang_get:nNN {##1}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpb_tl
               \tl_if_eq:eeF{\l__pdfmeta_tmpa_tl}{\l__pdfmeta_xmp_metalang_tl}
                 {
                   \__pdfmeta_xmp_add_packet_line_attr:nneV
                    {rdf}{li}{xml:lang="\l__pdfmeta_tmpa_tl" }\l__pdfmeta_tmpb_tl
                 }
             }
         \__pdfmeta_xmp_add_packet_close:nn{rdf}{#3}
        \__pdfmeta_xmp_add_packet_close:nn {#1}{#2}
      }
  }
\cs_generate_variant:Nn \__pdfmeta_xmp_add_packet_list:nnnn {nnne}
```

4.5.2 Building the main packet

`\__pdfmeta_xmp_build_packet:`

This is the main command to build the packet. As data has to be set and collected first, it will be expanded rather late in the document.

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_packet:
  {
```

Get the main languages

```
    \tl_set:Ne \l__pdfmeta_xmp_doclang_tl  {\pdfmanagement_get_documentproperty:n{document/la
    \tl_set:Ne \l__pdfmeta_xmp_metalang_tl {\pdfmanagement_get_documentproperty:n{hyperref/pd
```

```
    \tl_if_blank:VT \l__pdfmeta_xmp_metalang_tl
     { \cs_set_eq:NN \l__pdfmeta_xmp_metalang_tl\l__pdfmeta_xmp_doclang_tl}
```

we preprocess a number of data to be able to suppress them and their schema if there are unused. Currently only done for iptc

```
    \__pdfmeta_xmp_build_iptc_data:N \l__pdfmeta_xmp_iptc_data_tl
    \tl_if_empty:NT \l__pdfmeta_xmp_iptc_data_tl
      {
        \seq_remove_all:Nn \l__pdfmeta_xmp_schema_seq { Iptc4xmpCore }
      }
```

The start of the package. No need to try to juggle with catcode, this is fix text

```
      \__pdfmeta_xmp_add_packet_chunk:e
       {<?xpacket~begin="\__pdfmeta_xmp_generate_bom:"~id="W5M0MpCehiHzreSzNTczkc9d"?>}
      \__pdfmeta_xmp_add_packet_open:nn{x}{xmpmeta~xmlns:x="adobe:ns:meta/"}
       \__pdfmeta_xmp_add_packet_open:ne{rdf}
         {RDF~xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns\c_hash_str"}
```

The rdf namespaces

```
        \__pdfmeta_xmp_add_packet_open_attr:nne
          {rdf}{Description}{rdf:about="" \g__pdfmeta_xmp_xmlns_tl}
```

The extensions

```
        \__pdfmeta_xmp_add_packet_open:nn{pdfaExtension}{schemas}
         \__pdfmeta_xmp_add_packet_open:nn {rdf}{Bag}
           \seq_map_inline:Nn \l__pdfmeta_xmp_schema_seq
              {
                \tl_use:c { g__pdfmeta_xmp_schema_##1_tl }
              }
         \__pdfmeta_xmp_add_packet_close:nn {rdf}{Bag}
        \__pdfmeta_xmp_add_packet_close:nn {pdfaExtension}{schemas}
```

Now starts the part with the data.

```
    % data
        \__pdfmeta_xmp_build_pdf:
        \__pdfmeta_xmp_build_xmpRights:
        \__pdfmeta_xmp_build_standards: %pdfaid,pdfxid,pdfuaid
        \__pdfmeta_xmp_build_pdfd:
        \__pdfmeta_xmp_build_dc:
        \__pdfmeta_xmp_build_photoshop:
        \__pdfmeta_xmp_build_xmp:
        \__pdfmeta_xmp_build_xmpMM:
        \__pdfmeta_xmp_build_prism:
        \__pdfmeta_xmp_build_iptc:
        \__pdfmeta_xmp_build_tdm:
        \__pdfmeta_xmp_build_user: %user additions
    % end
      \__pdfmeta_xmp_add_packet_close:nn {rdf}{Description}
     \__pdfmeta_xmp_add_packet_close:nn {rdf}{RDF}
    \__pdfmeta_xmp_add_packet_close:nn {x}{xmpmeta}
    \int_set:Nn  \l__pdfmeta_xmp_indent_int{20}
    \prg_replicate:nn{10}{\__pdfmeta_xmp_add_packet_chunk:n {}}
    \int_zero:N \l__pdfmeta_xmp_indent_int
    \__pdfmeta_xmp_add_packet_chunk:n {<?xpacket~end="w"?>}
}
```

(*End of definition for* `\__pdfmeta_xmp_build_packet:`.)

4.6 Building the chunks: rdf namespaces

This is the list of external names spaces. They are rather simple, and we store them directly into a string. Special chars should be escaped properly, see e.g. `\c_hash_str` for the hash.

`\g__pdfmeta_xmp_xmlns_tl` `\g__pdfmeta_xmp_xmlns_prop`

The string will hold the prepared chunk, the prop stores the name spaces so that one can check on the user level for duplicates.

```
\str_new:N  \g__pdfmeta_xmp_xmlns_tl
\prop_new:N \g__pdfmeta_xmp_xmlns_prop
```

(*End of definition for* `\g__pdfmeta_xmp_xmlns_tl` *and* `\g__pdfmeta_xmp_xmlns_prop`.)

`\__pdfmeta_xmp_xmlns_new:nn`

```
\cs_new_protected:Npn \__pdfmeta_xmp_xmlns_new:nn #1 #2
  {
    \prop_gput:Nnn \g__pdfmeta_xmp_xmlns_prop {#1}{#2}
    \tl_gput_right:Ne \g__pdfmeta_xmp_xmlns_tl
      {
        \__pdfmeta_xmp_indent:n{4} xmlns:\exp_not:n{#1="#2"}
      }
  }
```

(*End of definition for* `\__pdfmeta_xmp_xmlns_new:nn`.)

Now we fill the data. The list is more or less the same as in hyperxmp The pdfxid entry is only added if an X standard is used, see issue #50 and the schema below.

```
\__pdfmeta_xmp_xmlns_new:nn {pdf}       {http://ns.adobe.com/pdf/1.3/}
\__pdfmeta_xmp_xmlns_new:nn {xmpRights}{http://ns.adobe.com/xap/1.0/rights/}

\__pdfmeta_xmp_xmlns_new:nn {tdm}{http://www.w3.org/ns/tdmrep/}
```

4.7 Building the chunks: Extensions

In this part local name spaces or additional names in a name space can be declared. A "schema" declaration consist of the declaration of the name, uri and prefix which then surrounds a bunch of property declarations. The current code doesn't support all syntax options but sticks to what is used in hyperxmp and pdfx. If needed it can be extended later.

\l__pdfmeta_xmp_schema_seq This variable will hold the list of prefix so that we can loop to produce the final XML

```
\seq_new:N \l__pdfmeta_xmp_schema_seq
```

(*End of definition for* `\l__pdfmeta_xmp_schema_seq`.)

__pdfmeta_xmp_schema_new:nnn With this command a new schema can be declared. The main tl contains the XML wrapper code, it then includes the list of properties which are created with the next command.

```
\cs_new_protected:Npn \__pdfmeta_xmp_schema_new:nnn #1 #2 #3
  %#1 name #2 prefix, #3 text
  {
    \tl_if_exist:cTF { g__pdfmeta_xmp_schema_#2_tl }
      {
       \msg_warning:nnnn{pdfmeta}{xmp-defined}{schema}{#2}
      }
      {
        \seq_put_right:Nn \l__pdfmeta_xmp_schema_seq { #2 }
        \tl_new:c { g__pdfmeta_xmp_schema_#2_tl }
        \tl_new:c { g__pdfmeta_xmp_schema_#2_properties_tl }
        \tl_gput_right:cn { g__pdfmeta_xmp_schema_#2_tl }
          {
            \__pdfmeta_xmp_add_packet_open_attr:nnn{rdf}{li}{rdf:parseType="Resource"}
             \__pdfmeta_xmp_add_packet_line:nnn {pdfaSchema}{schema}{#1}
             \__pdfmeta_xmp_add_packet_line:nnn {pdfaSchema}{prefix}{#2}
             \__pdfmeta_xmp_add_packet_line:nnn {pdfaSchema}{namespaceURI}{#3}
             \__pdfmeta_xmp_add_packet_open:nn {pdfaSchema}{property}
              \__pdfmeta_xmp_add_packet_open:nn{rdf}{Seq}
                  \tl_use:c { g__pdfmeta_xmp_schema_#2_properties_tl }
              \__pdfmeta_xmp_add_packet_close:nn{rdf}{Seq}
             \__pdfmeta_xmp_add_packet_close:nn {pdfaSchema}{property}
            \cs_if_exist_use:c {__pdfmeta_xmp_schema_#2_additions:}
            \__pdfmeta_xmp_add_packet_close:nn{rdf}{li}
          }
      }
  }
```

(*End of definition for* `\__pdfmeta_xmp_schema_new:nnn`.)

__pdfmeta_xmp_property_new:nnnnn This adds a property to a schema.

```
\prop_new:N\g__pdfmeta_xmp_schema_property_prop
\cs_new_protected:Npn \__pdfmeta_xmp_property_new:nnnnn #1 #2 #3 #4 #5 %
    %#1 schema #2 name, #3 type, #4 category #5 description
  {
    \tl_if_exist:cTF { g__pdfmeta_xmp_schema_#1_properties_tl }
     {
       \prop_get:NeNF \g__pdfmeta_xmp_schema_property_prop {#1:#2}\l__pdfmeta_tmpa_tl
```

```
      {
        \prop_gput:Nee \g__pdfmeta_xmp_schema_property_prop {#1:#2}{#3}
        \tl_gput_right:cn { g__pdfmeta_xmp_schema_#1_properties_tl }
          {
            \__pdfmeta_xmp_add_packet_open:nn {rdf}{li~rdf:parseType="Resource"}
              \__pdfmeta_xmp_add_packet_line:nnn {pdfaProperty}{name}{#2}
              \__pdfmeta_xmp_add_packet_line:nnn {pdfaProperty}{valueType}{#3}
              \__pdfmeta_xmp_add_packet_line:nnn {pdfaProperty}{category}{#4}
              \__pdfmeta_xmp_add_packet_line:nnn {pdfaProperty}{description}{#5}
            \__pdfmeta_xmp_add_packet_close:nn{rdf}{li}
          }
      }
    }
    {
      \msg_warning:nnnn{pdfmeta}{xmp-undefined}{schema}{#1}
    }
}
```

(*End of definition for* `\__pdfmeta_xmp_property_new:nnnnn`.)

`\__pdfmeta_xmp_add_packet_field:nnn` This adds a field to a schema.

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_packet_field:nnn #1 #2 #3 %
  %#1 name #2 valuetype #3 description
  {
    \__pdfmeta_xmp_add_packet_open_attr:nnn {rdf}{li}{rdf:parseType="Resource"}
          \__pdfmeta_xmp_add_packet_line:nnn {pdfaField}{name}{#1}
          \__pdfmeta_xmp_add_packet_line:nnn {pdfaField}{valueType}{#2}
          \__pdfmeta_xmp_add_packet_line:nnn {pdfaField}{description}{#3}
    \__pdfmeta_xmp_add_packet_close:nn{rdf}{li}
  }
```

(*End of definition for* `\__pdfmeta_xmp_add_packet_field:nnn`.)

4.7.1 The extension data

The list of extension has been reviewed and compared with the list of namespaces which can be used in pdf/A-1[7]

[1] https://www.pdfa.org/wp-content/uploads/2011/08/tn0008_predefined_xmp_properties_in_pdfa-1_2008-03-20.pdf and the content of the namespaces as listed here [2] https://developer.adobe.com/xmp/docs/XMPNamespaces/pdf/

pdf property: Trapped. We ignore it, it seems to validate without it.

xmpMM properties DocumentID, InstanceID, VersionID, Renditionclass declared by hyperxmp. Properties InstanceID and OriginalDocumentID declared by pdfx (pdfx.xmp) With the exception of OriginalDocumentID all are already allowed and predefined.

```
\__pdfmeta_xmp_schema_new:nnn
  {XMP~Media~Management~Schema}
  {xmpMM}
  {http://ns.adobe.com/xap/1.0/mm/}
```

[7] While A-1 builds on PDF 1.4 and so it probably no longer relevant, it is not quite clear if one can remove this for A-2 and newer, so we stay on the safe side.

```
\__pdfmeta_xmp_property_new:nnnnn
  {xmpMM}
  {OriginalDocumentID}
  {URI}
  {internal}
  {The~common~identifier~for~all~versions~and~renditions~of~a~document.}
```

pdfaid properties part and conformance are declared by hyperxmp, but no here as already in http://www.aiim.org/pdfa/ns/id/. But we declare year so that it can be used also with older A-standards.

`pdfaid~(schema)`

```
\__pdfmeta_xmp_schema_new:nnn
  {PDF/A~Identification~Schema}
  {pdfaid}
  {http://www.aiim.org/pdfa/ns/id/}
\__pdfmeta_xmp_property_new:nnnnn
  {pdfaid}
  {year}
  {Integer}
  {internal}
  {Year~of~standard}
\__pdfmeta_xmp_property_new:nnnnn
  {pdfaid}
  {rev}
  {Integer}
  {internal}
  {Revision~year~of~standard}
```

(*End of definition for* `pdfaid~(schema)`.)

pdfuaid here we need (?) to declare the property "part" and "rev".

`pdfuaid~(schema)`

```
\__pdfmeta_xmp_schema_new:nnn
  {PDF/UA~Universal~Accessibility~Schema}
  {pdfuaid}
  {http://www.aiim.org/pdfua/ns/id/}
\__pdfmeta_xmp_property_new:nnnnn
  {pdfuaid}
  {part}
  {Integer}
  {internal}
  {Part~of~ISO~14289~standard}
\__pdfmeta_xmp_property_new:nnnnn
  {pdfuaid}
  {rev}
  {Integer}
  {internal}
  {Revision~of~ISO~14289~standard}
```

(*End of definition for* `pdfuaid~(schema)`.)

pdfx According to [1] not an allowed schema, but it seems to validate and allow to set the pdf/X version, hyperxmp declares here the properties `GTS_PDFXVersion` and `GTS_PDFXConformance`. Ignored as only relevant for older pdf/X version not supported by the pdfmanagement.

pdfxid we set this so that we can add the pdf/X version for pdf/X-4 and higher. This is only set if a pdf/X standard is used, see issue #50

`pdfxid~(schema)`

```
\cs_new_protected:Npn \__pdfmeta_xmp_add_pdfxid:
 {
  \__pdfmeta_xmp_xmlns_new:nn {pdfxid}   {http://www.npes.org/pdfx/ns/id/}

declarations The PDF Declarations mechanism allows creation and editing software to declare, via a PDF Declaration, a PDF file to be in conformance with a 3rd party specification or profile that may not be related to PDF technology. Their specification is for example described in https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf.

If declarations are added to the XMP-metadata they need (for pdf/A compliance) a schema declaration. We do not add it by default but define here a command to enable it. (This can be done in the document preamble as xmp is built only at the end.)

```
\cs_new_protected:Npn \__pdfmeta_xmp_schema_enable_pdfd:
 {
  \__pdfmeta_xmp_xmlns_new:nn {pdfd}{http://pdfa.org/declarations/}

```

4.8 The actual user / document data

4.8.1 pdf

This builds pdf related the data with the (prefix "pdf").

__pdfmeta_xmp_build_pdf:
Producer/pdfproducer
PDFversion

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_pdf:
  {
```

At first the producer. If not given manually we build it from the exec string plus the version number

```
  \__pdfmeta_xmp_add_packet_line_default:nnee
    {pdf}{Producer}
    {\c_sys_engine_exec_str-\c_sys_engine_version_str}
    {\pdfmanagement_get_documentproperty:n{hyperref/pdfproducer}}
```

Now the PDF version

```
   \__pdfmeta_xmp_add_packet_line:nne{pdf}{PDFVersion}{\pdf_version:}
  }
```

(*End of definition for* `\__pdfmeta_xmp_build_pdf:` , `Producer/pdfproducer` , *and* `PDFversion`.)

4.8.2 xmp

This builds the data with the (prefix "xmp").

__pdfmeta_xmp_build_xmp:
CreatorTool/pdfcreator
BaseUrl/baseurl

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_xmp:
  {
```

The creator

```
  \__pdfmeta_xmp_add_packet_line_default:nnee
    {xmp}{CreatorTool}
    {LaTeX}
    { \pdfmanagement_get_documentproperty:n{hyperref/pdfcreator} }
```

The baseurl

```
   \__pdfmeta_xmp_add_packet_line_default:nnee
     {xmp}{BaseURL}{}
     { \pdfmanagement_get_documentproperty:n{hyperref/baseurl} }
```

CreationDate

```
    \__pdfmeta_xmp_date_get:nNN
      {document/creationdate}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpa_seq
    \__pdfmeta_xmp_add_packet_line:nne{xmp}{CreateDate}{\__pdfmeta_xmp_print_date:N\l__pdfme
    \pdfmanagement_add:nne{Info}{CreationDate}{(\l__pdfmeta_tmpa_tl)}
```

ModifyDate

```
    \__pdfmeta_xmp_date_get:nNN
      {document/moddate}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpa_seq
    \__pdfmeta_xmp_add_packet_line:nne{xmp}{ModifyDate}{\__pdfmeta_xmp_print_date:N\l__pdfme
    \pdfmanagement_add:nne{Info}{ModDate}{(\l__pdfmeta_tmpa_tl)}
```

MetadataDate

```
    \__pdfmeta_xmp_date_get:nNN
      {hyperref/pdfmetadate}\l__pdfmeta_tmpa_tl\l__pdfmeta_tmpa_seq
    \__pdfmeta_xmp_add_packet_line:nne{xmp}{MetadataDate}{\__pdfmeta_xmp_print_date:N\l__pdf
  }
```

(*End of definition for* `\__pdfmeta_xmp_build_xmp:`, `CreatorTool/pdfcreator`, *and* `BaseUrl/baseurl`.)

4.8.3 Standards

The metadata for standards are taken from the `pdfstandard` key of the `document/metadata` family. The values for A-standards are taken from the property, X and UA are currently taken from the document container, this should be changed when merging of standards are possible.

`\__pdfmeta_xmp_build_standards:`

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_standards:
  {
    \__pdfmeta_xmp_add_packet_line:nne {pdfaid}{part}{\pdfmeta_standard_item:n{level}}

      {pdfaid}{conformance}{\pdfmeta_standard_item:n{conformance}}
    \int_compare:nNnTF {0\pdfmeta_standard_item:n{level}}<{4}
     {\__pdfmeta_xmp_add_packet_line:nne {pdfaid}{year} {\pdfmeta_standard_item:n{year}}}
     {\__pdfmeta_xmp_add_packet_line:nne {pdfaid}{rev}  {\pdfmeta_standard_item:n{year}}}
    \__pdfmeta_xmp_add_packet_line:nne
      {pdfxid}{GTS_PDFXVersion}{\pdfmanagement_get_documentproperty:n{document/pdfstandard-
X}}
    \pdfmanagement_get_documentproperty:nNT {document/pdfstandard-UA}\l__pdfmeta_tmpa_tl
     {
       \__pdfmeta_xmp_add_packet_line:nne
        {pdfuaid}{part}{\exp_last_unbraced:No\use_i:nn \l__pdfmeta_tmpa_tl}
      \__pdfmeta_xmp_add_packet_line:nne
        {pdfuaid}{rev}{\exp_last_unbraced:No\use_ii:nn \l__pdfmeta_tmpa_tl}
     }
  }
```

(*End of definition for* `\__pdfmeta_xmp_build_standards:`.)

4.9 Declarations

See https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf

`\g__pdfmeta_xmp_pdfd_data_prop` This holds the data for declarations.

```
\prop_new:N \g__pdfmeta_xmp_pdfd_data_prop
```

(*End of definition for* `\g__pdfmeta_xmp_pdfd_data_prop`.)

the main building command used in the xmp generation

`\__pdfmeta_xmp_build_pdfd:`

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_pdfd:
  {
    \prop_if_empty:NF\g__pdfmeta_xmp_pdfd_data_prop
      {
```

```
      \__pdfmeta_xmp_add_packet_open:nn{pdfd}{declarations}
      \__pdfmeta_xmp_add_packet_open:nn{rdf}{Bag}
        \prop_map_inline:Nn \g__pdfmeta_xmp_pdfd_data_prop
          {
            \__pdfmeta_xmp_build_pdfd_claim:nn{##1}{##2}
          }
      \__pdfmeta_xmp_add_packet_close:nn{rdf}{Bag}
      \__pdfmeta_xmp_add_packet_close:nn{pdfd}{declarations}
    }
}
```

(*End of definition for* `\__pdfmeta_xmp_build_pdfd:`.)

`\__pdfmeta_xmp_build_pdfd_claim:nn` This build the xml for one claim. If there is no claimData only the conformsTo is output.

```
\cs_new_protected:Npn \__pdfmeta_xmp_build_pdfd_claim:nn #1#2

   \int_zero:N \l__pdfmeta_xmp_indent_int
   \g__pdfmeta_xmp_user_packet_tl
   \int_set:Nn \l__pdfmeta_xmp_indent_int {3}
 }
```

(*End of definition for* `\__pdfmeta_xmp_build_user:`.)

4.18 Activating the metadata

We don't try to get the byte count. So we can put everything in the `shipout/lastpage` hook

```
\hook_new:n { pdfmeta/xmp }
\AddToHook{shipout/lastpage}[pdfmanagement-testphase]
  {
    \bool_if:NT\g__pdfmeta_xmp_bool
     {
       \str_if_exist:NTF\c_sys_timestamp_str
        {
          \tl_set_eq:NN \l__pdfmeta_xmp_currentdate_tl \c_sys_timestamp_str
        }
        {
          \file_get_timestamp:nN{\jobname.log}\l__pdfmeta_xmp_currentdate_tl
        }
       \__pdfmeta_xmp_date_split:VN\l__pdfmeta_xmp_currentdate_tl\l__pdfmeta_xmp_currentdate
       \hook_use:n { pdfmeta/xmp }
       \__pdfmeta_xmp_build_packet:
       \pdf_object_new:n {__pdfmeta/xmp}
       \exp_args:No
       \__pdf_backend_metadata_stream:n {\g__pdfmeta_xmp_packet_tl}
        \pdfmanagement_add:nne {Catalog} {Metadata}{\pdf_object_ref:n{__pdfmeta/xmp}}
       \bool_if:NT \g__pdfmeta_xmp_export_bool
        {
          \iow_open:Nn\g_tmpa_iow{\g__pdfmeta_xmp_export_str.xmpi}
